Abstract
Goat milk paneer has softer body than buffalo milk paneer since got milk is lower in calcium content. The present study was conducted on goat milk paneer using CaCl₂ to increasing the yield and improves sensory quality (General appearance, Taste and flavour, Body and texture and Overall acceptability) of goat milk paneer. Different levels of calcium chloride in goat milk for preparation of paneer were used like C₀ (control), C₁ (0.08%), C₂ (0.10%) and C₃ (0.12%). The statistical analysis of data revealed significant (P<0.05) effect on sensory quality of paneer due to treatment in all group. Yield of paneer (P>0.05) were not affected by CaCl₂. A level of calcium chloride 0.10 percent was found to be best suited, because it resulted in good quality goat milk paneer.

Keywords: Goat milk, calcium chloride, paneer, yield, sensory quality

1. Introduction
Livestock sector plays an important role in India economy. Goats are important part of livestock industry and play a crucial role in the socio-economic structure of marginal farmers in India. India possess 148.88 million goats and is ranked second in the world in terms of goat population (Basic Animal Husbandry Statistics, 2019) [5]. Total milk production in India is 230.58 million tone and goat milk contribution is 3.30 percent of total milk production in India (Basic Animal Husbandry Statistics, 2023) [6]. Goat milk has been recommended as an ideal substitute for cow and human milk (Zenebe et al., 2018) [11]. Goat milk can be used to prepare a wide variety of dairy products as paneer, cheese, butter, ice-cream, butter milk, condensed milk, yoghurt, flavoured milk, sweets and candy (Fazilah et al., 2018) [5]. The growing consumer interest in goat’s milk and its dairy products is related to the nutritional benefits offered by these products (Clark & Gacia, 2017) [2]. Good quality paneer is characterized by a marble white color, sweetish, mildly acidic taste, nutty flavour, spongy body and closely-knit smooth texture (Patel, 1991) [9]. Enriching milk and dairy products with calcium is a common practice today. Calcium supplementation of milk is usually achieved by adding soluble calcium salts such as calcium chloride, calcium lactate and calcium gluconate, or less-soluble calcium salts like calcium carbonate and calcium citrate (Singh et al. 2007; Omoarukhe et al. 2010) [11, 8]. The present research work was carried out as an attempt to utilize goat milk for the preparation of paneer, a value-added product. In order to increasing the yield and improves sensory quality (General appearance, Taste and flavour, Body and texture and Overall acceptability) of goat milk paneer.

2. Materials and Methods
2.1 Procurement of milk: Goat milk was procured from livestock research station, Bojunda, Chittorgarh and standardized to 5 percent fat for preparation of paneer.

2.2 Additives used: Different levels of calcium chloride in goat milk were used as additives like C₁ (0.08%), C₂ (0.10%) and C₃ (0.12%) to preparation of paneer. The product was prepared by the process suggested by Sachadeva and Singh (1988) [10]. The standardized goat milk was added with calcium chloride and heated to 90 °C than subsequently cooled to 85 °C and add 1
percent citric acid solution as coagulant slowly with continuous agitation till clear whey separated out. The curd was left for 5-10 minutes in the whey and then drained through muslin cloth and pressed in a hoof at 2-3 kg/cm² pressure. Paneer block was dipped in chilled water for 5-10 minute and packaged in pre-sterilized LDPE pouches and stored at 5 °C.

2.3 Yield of goat milk paneer: The yield of goat milk paneer obtained was weighed and recorded as per cent yield of the milk used for preparation of goat milk paneer in each treatment.

2.4 Sensory analysis of paneer: The paneer prepared under different treatments during the course of the investigation was subjected to the sensory evaluation by a panel of five judges from the Department of Livestock Products Technology and Department of Veterinary Public Health by using the procedure described in IS 6273 (Part II) (1971) [15]. The product was judged for different quality attributes by 9-point Hedonic scale (Amerine et al., 1967) [1] with suitable modifications.

2.5 Statistical analysis: Data were statistically analyzed by using the method described by Snedecor and Cochran (1989) [13].

3. Results and Discussion
To study the effect of calcium chloride, paneer was prepared from goat milk added with various level of calcium chloride using 1 percent citric acid solution as coagulant at 85 °C coagulation temperature.

3.1 Effect of calcium chloride on yield of paneer.
The results of mean values of effect of calcium chloride on yield of paneer are presented in Table 1. The yield of a paneer made using different calcium chloride fortification levels was comparable with one another but they had higher values than control. The present findings are in agreement with those of Singh and Kanawjia (1988) [12] who reported calcium helps in building the cross linkages during the formation of curd and thus helps in increasing the recovery of milk solids, yield and improves body and texture and overall acceptability scores of paneer. Hill et al. (1982) [4] recommended use of high temperature and CaCl₂ for getting better yield through co-precipitation of casein and whey proteins.

Each observation is a mean ± SE of three replicate experiment (n=3). Mean in column bearing a common superscript do not differ significantly (p<0.05). Control (C₀): Without calcium chloride C₁: With 0.08% calcium chloride C₂: With 0.10% calcium chloride C₃: With 0.12% calcium chloride

3.2 Effect of calcium chloride on sensory quality of paneer prepared from goat milk
The results obtained are presented in Table 2 which represents the influence of various level of calcium chloride on the sensory attributes of experimental goat milk paneer viz. general appearance, taste and flavour, body and texture and overall acceptability.

3.2.1 General appearance: The mean value for general appearance for control (C₀) was 6.23±0.16 and for treatments group C₁, C₂ and C₃ were 7.00±0.02, 7.93±0.04 and 7.33±0.15 respectively. It is revealed that the score for general appearance with different level of calcium chloride differed significantly (p<0.05). The general appearance score for C₂ group was observed to be significantly higher than C₁ and C₀ while C₂ and C₃ were non-significant to each other.

3.2.2 Taste and flavor: The mean value for taste and flavor for control (C₀) was 6.00±0.16 and for treatments group C₁, C₂ and C₃ were 6.70±0.08, 7.50±0.01 and 6.86±0.16 respectively. It is revealed that the score for taste and flavour with different level of calcium chloride differed significantly (p<0.05). The taste and flavor score for C₂ group was observed to be significantly higher than all groups while group C₁ and C₃ were non-significant to each other and group C₀ and C₁ were non-significant to each other.

3.2.3 Body and texture and overall acceptability: The mean value body and texture for control (C₀) was 6.00±0.28 and for treatments group C₁, C₂ and C₃ were 7.03±0.13, 7.70±0.06 and 7.30±0.20 respectively. The mean value for overall acceptability for control (C₀) was 6.00±0.15 and for treatments group C₁, C₂ and C₃ were 7.06±0.07, 7.76±0.05 and 7.23±0.22 respectively. The score for body and texture and overall acceptability of a goat milk paneer treated with calcium chloride levels differed significantly (p<0.05). It is further noticed that values for body and texture and overall acceptability of all treatment significantly higher than C₀ but other levels i.e C₁, C₂, C₃ were non-significant to each other.

These above findings for general appearance, taste and flavor, body and texture and overall acceptability are in accordance with the observations of Singh and Kanawjia (1988) [12] for the use of 0.10 percent calcium chloride in the manufacture of paneer from cow milk. Sachdeva et al. (1991) [11] observed that incorporation of 0.08% CaCl₂ in manufacture of cow milk paneer helped in improving the sensory score for appearance, flavour, body and texture compared to milk without added calcium salt.

On the basis of the study, it can be seen that sensory quality of paneer was affected significantly (P<0.05) by CaCl₂ and C₂ was preferred the most with respect to all the attributes studied from amongst all the experimental samples. A level of calcium chloride 0.10 percent was found to be best suited, because it resulted in good quality goat milk paneer (Table 2)

Each observation is a mean ± SE of three replicate experiment (n=3).
Mean in column bearing a common superscript do not differ significantly (p<0.05).
Control (C⁰): Without calcium chloride C¹: With 0.08% calcium chloride
C²: With 0.01% calcium chloride C³: With 0.12% calcium chloride.

4. Conclusion
On the basis of the results obtained in the experiment, it is concluded that yield of paneer (P>0.05) were not affected by CaCl₂. Sensory quality of paneer were significantly (P<0.05) affected by CaCl₂. A level of calcium chloride 0.10 percent was found to be best suited, because it resulted in good quality goat milk paneer.
